

World Water Day: responsible Wastewater Treatment for a sustainable future

Water is life, and protecting it is our duty. According to the UN¹, more than 80% of wastewater re-enters the environment untreated. The impact on water safety and loss of biodiversity is tangible.

Water is never owned, only borrowed and we owe a duty of care to those around us and those that will follow us.

At Agreenco Environmental Projects, we believe that the answer to sustainable water management resides in biological wastewater treatment, a natural, efficient, and ecologically sound solution to restore water quality and safeguard ecosystems.

We are dedicated to rethinking wastewater treatment. With our best-in-class onsite operations teams, our clients gain valuable peace of mind, knowing that your compliance is our passion.

On World Water Day, let's work together to protect our most precious resource.
